How can I add a whole list of words to my dictionary?

User dictionaries are text files, one line per word with CR end. They are saved as Type "DICU", creator "MMBB". Words must be alpha sorted, and are case sensitive. You can select a document, and click learn in the spell dialog (will learn multiple words at once to the user dictionary). Large documents may take some extra time to process. To create a custom dictionary, start with the "empty" dictionary provided. Then add words from user dictionaries using the merge command.
